EX.NO: 3

DEPTH FIRST SEARCH - WATER JUG PROBLEM

In the water a jet ground be demith that if living I brite his wange

the capacity to hold 3 gallons of water and the other has the capacity to hold 4 gallons of water. There is no other measuring equipment available and the jugs also do not have any kind of marking on them. So, the agent's task here is to fill the 4-gallon jug with 2 gallons of water by using only these two jugs and no other material. Initially, both our jugs are empty.

AIM:

To implement a python program for Water Jug problem using depth first search problem SOURCE CODE:

from collections import deque

def DFS(a, b, target):

```
m = \{\}
isSolvable = False
path = []
q = deque()
q.append((0, 0))
while (len(q) > 0):
  u = q.popleft()
  if ((u[0], u[1]) in m):
     continue
  if ((u[0] > a \text{ or } u[1] > b \text{ or } u[1] > b)
     u[0] < 0 \text{ or } u[1] < 0):
     continue
  path.append([u[0], u[1]])
  m[(u[0], u[1])] = 1
  if (u[0] == target or u[1] == target):
     isSolvable = True
     if (u[0] == target):
     if (u[1] != 0):
          path.append([u[0], 0])
     else:
       if (u[0] != 0):
        path.append([0, u[1]])
       sz = len(path)
       for i in range(sz):
         print("(", path[i][0], ",",path[i][1], ")")
     break
  q.append([u[0], b])
  q.append([a, u[1]])
```

OUTPUT:

```
Path from initial state to solution state ::
(0,0)
(0,3)
(4,0)
(4,3)
(3,0)
(1,3)
(3,3)
(4,2)
(0,2)
```

RESULT:

Thus the python code is implemented and the output is verified
